News briefs from January to May 2025

After a mixed harvest in 2024, this year's dry season has been busy with various activities carried out by the different sections of the farm.

The activities of the different sections are described below:

***** At the Land Development Unit:

The year began with the continued development of the two bocage perimeters of Lindi and Tounda, through the digging of internal trenches and ponds.

In Lindi, the construction of the protective bulli has been completed, followed by internal development (trenches, ponds, and tree holes). All openings have been installed.

In Tounda, too, the work mainly focused on digging internal trenches and ponds.

All the teams involved in the work have been paid. As some team members are internally displaced persons, this is a significant source of income for them.

❖ Maintenance of the Bocage

During the period from January to May, we carried out most of the maintenance work on trees along wooded roads and hedgerows.

On the roads, we pruned the trees to allow them to grow taller while preventing the side branches from obstructing traffic.

We also replaced dead tree holes for replanting during the rainy season.

The maintenance

successfully completed. Work was carried out at seven sites, resulting in a total of 5.56 kilometers of hedgerows being pruned.

Our activities were mainly focused on soil decompaction in several fields within and outside the bocage areas.

The decompaction of fields to facilitate Zaï digging was carried out in the bocage areas and also in fields outside these areas. Over the period, we were able to work on approximately 60 hectares of fields. The operation will continue in June, which is the last month for this activity.

At the nursery

During this period, we produced around **15,000 trees and shrubs of 48 different species**. The provisional figures for the different species are shown in the following table:

Acacia macrostachya Zamenega 1 Acacia nilotica Pegnenga 4 Adansonia digitata Baobab Toèga 5 Anonna Anone - Anonna squamosa Cinnamon apple Baa-taam Anongeissus leiocarpus African birch Siiga 5 Azadirachta indica Neem tree Niim 4 Bauhinia rufescens Tipoega Bombax costatum Red-flowered kapok tree Tipoega Bombax costatum Red-flowered kapok tree Voaka 2 Carica papaya Papaya tree Bogfire 5 Ceiba pentandra Kapok tree Gounga 5 Citrus limon Lemon tree Lembourmissinga 4,6 Crescentia cujete Calabash tree Wam-tiiga 4,6 Crescentia cujete Calabash tree Wam-tiiga 4,6 Guinean dseialium Black tamarind tree Mak-poussa African ebony Gāaka Eucalyptus camaldulensis Eucalyptus - 4 Ficus on Tropical ficus Wom-sèga 2	Species	English name	Mooré name	Quantity produced 2025

At their request, we trained six women from the village of Guiè in the production of Zamenega (*Acacia macrostachya*), a species that is overexploited for its fruits, which are highly prized in large cities. The aim is for them to be able to produce it themselves and plant it in their hedgerows.

At the Animation

We started the year by supporting farmers in the bocage areas with joint projects, including cleaning firebreaks and repairing fences.

through the provision of inputs (*equipment and compost*) to 250 farming households. With training on the Zaï technique now complete, we are monitoring its application by beneficiaries in their fields.

Performance bonuses were distributed to the 351 producers surveyed last year in the bocage areas. Based on the points they earned, each received agricultural equipment and compost.

As the dry season draws to a close, we have not had any rain that would allow us to sow the fields. We hope that June will be the month when the agricultural season can effectively begin.

At the Park

During the dry
season, our
main activities
were rational
grazing of
the fields and
also
feeding
livestock in pens.

❖ At the Lindi farm

Activities continued smoothly, mainly with the establishment of market gardening activities with the production of various crops (lettuce, amaranth, sorrel, etc.),

harvesting and packaging 36 liters of honey for sale...

...and the maintenance of two fruit orenards through regular watering

Noni juice was also extracted, with approximately 6 liters obtained.

All of the production was sold to the farm's customers.
